Puzzles of Inflation, Money, and Debt: Applying the Fiscal Theory of the Price Level - Thomas S. Coleman 2021-11-29

The fiscal theory of the price level (FTPL) provides an update and revision of monetary theory to address puzzles raised by the failure of both the new Keynesian theory (commonly used by central bankers) and neoclassical monetarism (in particular, the quantity theory of money as interpreted by Milton Friedman and Anna Schwartz)—puzzles such as the low inflation that followed the sustained expansionary monetary policies post-2008. We aim to summarize and explain the FTPL as developed by Eric Leeper, John Cochrane, and others. The FTPL builds on neoclassical monetarism by observing that government liabilities—bonds, notes, bills, and currency—derive their value from the assets that back these liabilities. These assets are chiefly the present value of future tax revenues, minus government spending other than that part of spending used to service the liabilities themselves. This net “profit” of the government is called the primary surplus. This primary surplus can be expressed in real terms (a quantity of goods and services, rather than a money amount). The total real value of the bonds is thus the total real value of the assets backing the bonds: the present value of all future real primary surpluses (which we shorten to PVFS, present value of future surpluses). In a very important sense, the FTPL harkens back to commodity-based theories of money, except now the “commodity” is the real value of future surpluses earned by the government. We can then solve for the price level. It is simply the nominal value of the bonds (the face value or number of bonds issued) divided by the real value of the bonds (the PVFS). If the nominal value of the bonds is held constant and the underlying asset (PVFS) becomes less valuable, prices go up. If the PVFS becomes more valuable, prices go down. We thus calculate the value of “money” (including government liabilities of all maturities) the way one would calculate the value of any security: through discounted cash flow analysis. Note that this approach is consistent with the QTM because, if money is defined in the traditional way as currency and demand deposits and we now hold the PVFS (the backing of the money) constant, then the price level is proportional to

the amount of money in circulation. The FTPL is a more complete theory, however, because (1) it incorporates all government liabilities, not traditional money alone, and (2) because it is forward-looking and dynamic rather than considering only conditions in the present.

The Everyday Practice of Valuation and Investment - Horacio Ortiz

2021-11-23

The financial industry derives its legitimacy through the claim that it acts in the interest of shareholders. A vast international network of funds, banks, insurance companies, brokerages, rating agencies, and regulatory agencies defends its status by asserting that market mechanisms determine a company's true value and therefore enriching shareholders contributes to the socially optimal allocation of capital. Is this how stock prices are determined in practice? What does stock valuation reveal about the supposed efficiency of markets and what it means to act on behalf of shareholders? Horacio Ortiz provides a critical analysis of the social institutions and practices that produce and regulate stock pricing and valuation. He examines how financial professionals evaluate and invest in listed companies, unraveling the contradictory definitions of financial value that shape their behavior. Ortiz demonstrates how ideologically laden notions of investing skill and efficient markets are central to the everyday practices of financial valuation, as well as how they function to justify the broader system. He scrutinizes the technical aspects of valuation and investment, their place in social relations within and among companies, and their relation to state regulation in order to demystify how the financial industry presents prices as truths that the rest of society must accept. Drawing on ethnographic fieldwork conducted among stock brokers and investment management companies in New York and Paris, this book shows how the political imaginaries that underpin financial markets are central to producing, sustaining, and legitimizing global inequalities.

Invisible Women - Caroline Criado Perez 2019-03-12

Data is fundamental to the modern world. From economic development, to healthcare, to education and public policy, we rely on numbers to allocate resources and make crucial decisions. But because so much data fails to take into account gender, because it treats men as the default and women as atypical, bias and discrimination are baked into our systems. And women pay tremendous costs for this bias, in time, money, and often with their lives. Celebrated feminist advocate Caroline Criado Perez investigates shocking root cause of gender inequality and research in *Invisible Women*†, diving into women's lives at home, the workplace, the public square, the doctor's office, and more. Built on hundreds of studies in the US, the UK, and around the world, and written with energy, wit, and sparkling intelligence, this is a groundbreaking, unforgettable exposé that will change the way you look at the world. *Afanasy Nikitin's Voyage Beyond Three Seas* - Afanasiï Nikitich Nikitin 1985

This book presents a systematic application of recent advances in artificial intelligence (AI) to the problem of asset management. While natural language processing and text mining techniques, such as semantic representation, sentiment analysis, entity extraction, commonsense reasoning, and fact checking have been evolving for decades, finance theories have not yet fully considered and adapted to these ideas. In this unique, readable volume, the authors discuss integrating textual knowledge and market sentiment step-by-step, offering readers new insights into the most popular portfolio optimization theories: the Markowitz model and the Black-Litterman model. SchweserNotes for the CFA Exam - 2020

Equity Valuation: Science, Art, or Craft? - Frank J. Fabozzi 2017-12-27

The price at which a stock is traded in the market reflects the ability of the firm to generate cash flow and the risks associated with generating the expected future cash flows. The authors point to the limits of widely used valuation techniques. The most important of these limits is the inability to forecast cash flows and to determine the appropriate discount rate. Another important limit is the inability to determine absolute value. Widely used valuation techniques such as market multiples - the price-to-earnings ratio, firm value multiples or a use of multiple ratios, for example - capture only relative value, that is, the value of a firm's stocks related to the value of comparable firms (assuming that comparable firms can be identified). The study underlines additional problems when it comes to valuing IPOs and private equity: Both are sensitive to the timing of the offer, suffer from information asymmetry, and are more subject to behavioral elements than is the case for shares of listed firms. In the case of IPOs in particular, the authors discuss how communication strategies and media hype play an important role in the IPO valuation/pricing process.

Behavioral Finance: The Second Generation - Meir Statman
2019-12-02

Behavioral finance presented in this book is the second-generation of behavioral finance. The first generation, starting in the early 1980s,

largely accepted standard finance's notion of people's wants as "rational" wants—restricted to the utilitarian benefits of high returns and low risk. That first generation commonly described people as "irrational"—succumbing to cognitive and emotional errors and misled on their way to their rational wants. The second generation describes people as normal. It begins by acknowledging the full range of people's normal wants and their benefits—utilitarian, expressive, and emotional—distinguishes normal wants from errors, and offers guidance on using shortcuts and avoiding errors on the way to satisfying normal wants. People's normal wants include financial security, nurturing children and families, gaining high social status, and staying true to values. People's normal wants, even more than their cognitive and emotional shortcuts and errors, underlie answers to important questions of finance, including saving and spending, portfolio construction, asset pricing, and market efficiency.
